

Scenario Based Learning

A company works with number of employees, all the works are dependents on the employees. Even if one of the employees resign the job immediately then assigned work will be not finished at the time, so delivery of the project to the clients will be delayed. Company planned to make solution for this, they want to know which employee may resign next. If they know previously, they can arrange alternative to avoid such problem. As an AI Engineer you must give Solution to this.

A) How will you achieve this in AI?

To achieve the solution for employee resignation prediction , we might have to analyze the employee work behavior, employee satisfaction and employee performance data which will play a major role in helping us predict the employee resignation prediction. For example if an employee's work behavior and employee satisfaction data are below the company's set standards the data of those employees are taken into consideration for making a prediction.

B) Find out the 3 -Stage of Problem Identification

Stage 1- Machine Learning

Stage 2 - Supervised

Stage 3 - Classified.

C) Name the project

The Project name : Employee Retention Project

D) Create the dummy Dataset.

Employee Satisfaction Data:

Emp_ID	Emp_Name	Emp_Department	Emp_Satisfaction
112	Bharath	Revenue	9
113	Swetha	IT	5
114	Vignesh	Networking	7
...	...	...	...

Employee Performance Data:

Emp_ID	Emp_Name	Emp_Id	Perfomance_Score	Work_hrs
124	Ramesh	R2	9	45
115	Arnav	A3	3	40
134	Dhanush	I4	4	35

Scenario Based Learning

Based on the Dataset the following data will be provided as Input to derive the Output for the Employee Retention Project

Emp_ID	Emp_Name	Emp_ID	Emp_Satisfactin	Perfomance_Score	Work_hrs	O/P
112	Bharath	R2	9	9	50	Not Resigned
113	Swetha	I4	5	7	30	Resigned
114	Vignesh	N2	7	8	40	Not Resigned
124	Ramesh	R2	8	9	45	Not Resigned
115	Arnav	A3	6	3	40	Resigned
134	Dhanush	I4	6	4	35	Resigned
